Scored: cds7

I. Scale Description

The NIMH Diagnostic Interview Schedule for Children (DISC) assesses DSM-IV psychiatric symptoms and diagnoses in children and adolescents aged 6 to 17 years by interviewing parents.¹ The DISC was designed to be given by lay interviewers for epidemiological research. Fast Track administered the measures using a laptop computer (Computerized DISC, or CDISC).

Item Responses

The DISC items are organized by diagnosis. Parents are asked if their children experienced specific symptoms related to a disorder during the past month or year.² If a parent reports that a child experienced a given symptom, additional follow-up questions are asked.

The one exception is conduct disorder. Symptoms of conduct disorder are recorded for the previous 6 months and the previous year. Consequently, the dataset contains 2 criterion count variables, one for the previous 6 months and one for the previous year. The dataset contains only one diagnosis indicator for the previous year.

¹ The corresponding measure in year 4 assesses symptom and diagnoses defined by the DSM-III-R.

² In year 4, symptoms are reported for the previous 6 months.

The possible responses to most of the DISC questions are "No" (0), "Yes" (1), "Not Applicable" (8), or "Don't Know" (9). During the scoring process, the "Don't Know" responses are recoded as "No". Parent responses capture whether the parent knows that their child has experienced a symptom. If a parent does not know if their child experienced the symptom, symptom should be coded "No".

Fast Track collected data on the following disorders in year 7/grade 6:

- Attention Deficit/Hyperactivity Disorder (ADHD)
- Agoraphobia
- Conduct Disorder
- Dysthymia
- Eating Disorders (Anorexia Nervosa and Bulimia)
- Generalized Anxiety
- Hypomania
- Major Depression
- Mania
- Obsessive Compulsive (OC) Disorder
- Oppositional Defiance (OD) Disorder
- Panic Disorder
- Post Traumatic Stress Disorder (PTSD)
- Separation Anxiety (SA)
- Specific Phobia
- Social Phobia.

II. Report Sample

The explanatory analyses in this report are conducted on the Cohort 1 normative (n=387) and high-risk control samples (n=155, N=463 with overlap) in grade6/year 7. Sixty-one students are missing the entire measure (13% of the sample), including 53 from the normative sample (14% of the sample) and 16 from the high-risk control sample (10% of the sample). The respondents who did not complete the measure include 12 students from Durham (10%), 13 from Nashville (12%), 12 from Penn State (10%), and 24 from Seattle (22%).

III. Scaling

The DISC group at Columbia University and New York State Psychiatric Institute (overseen by David Shaffer, M.D., Prudence Fisher, Ph.D., and John Piacentini, Ph.D) constructed the scoring programs that correspond to the DSM-IV. The variables names were changed to match the Fast Track format. The three types of summary scores are described below.

Criterion Counts

The scoring program combines the symptom (item) responses to determine whether a child meets a particular DSM-IV criterion. Multiple symptoms are often used to determine whether one criterion is satisfied. The criterion count variable describes the total number of criteria a child meets for each disorder.

Diagnosis Indicators

The individual symptom responses are also used to determine whether a child meets the DSM-IV specification for a diagnosis. The diagnosis variable equals 1 if the child meets the diagnosis criteria for a given disorder and 0 otherwise.

Impairment Indicators

The DISC also includes a series of questions designed to determine whether experiencing the symptoms associated with a particular diagnosis impaired the child's ability to participate in normal daily activities. Based on these questions, the scoring program creates three additional indicator variables for meeting the requirements of a diagnosis and experiencing a certain level of impairment. The levels include: experiencing intermediate or severe impairment in regards to at least 1 activity, experiencing intermediate or severe

impairment in regards to at least 2 activities, and experiencing a severe impairment in regards to at least 1 activity. The diagnosis with impairment variable equals 1 if the subject meets the diagnosis criteria and experienced a certain level of impairment in his/her life.³

IV. Differences Between Groups

T-tests for equality of means were conducted between the high-risk control and the low-risk normative samples for the year and month criteria counts for each disorder.

Mean criterion counts differed at the 0.05 significance level for the high-risk control and low-risk normative samples for the following disorders:

Month:	ADHD-Hyperactivity ADHD-Inattention ADHD-Combined Conduct Disorder Eating Disorders Obsessive Compulsive (OC) Disorder Oppositional Defiance (OD) Disorder Separation Anxiety (SA) Specific Phobia
Year:	ADHD-Hyperactivity ADHD-Inattention ADHD-Combined Conduct Disorder Obsessive Compulsive (OC) Disorder Oppositional Defiance (OD) Disorder Separation Anxiety (SA) Specific Phobia

Chi-Square tests of independence between the high-risk control and the low-risk normative sample were conducted for the year and month diagnosis and diagnosis plus impairment variables. The results for many of the tests, however, are questionable given the low frequency of diagnoses for many disorders. A test may not be valid if fewer than 5 respondents in a sample (normative or control) were expected to meet the diagnosis criteria (or the diagnosis plus impairment criteria). An * indicates that fewer than 5 respondents in both samples were expected to meet the criteria, while an ** indicates that fewer than 5 respondents in one sample were expected to meet the criteria.

The hypothesis of independence between risk category (high-risk control and normative) and diagnosis was rejected at the 0.05 significance level for the following disorders:

Month:	ADHD-Inattention* ADHD-Combined* ADHD-Any Conduct Disorder Obsessive Compulsive (OC) Disorder* Oppositional Defiance (OD) Disorder Separation Anxiety (SA)
Year:	ADHD-Inattention* ADHD-Combined ** ADHD-Any Conduct Disorder

³ Year 4 includes an alternative measure of impairment.

Major Depression
 Obsessive Compulsive (OC) Disorder*
 Oppositional Defiance (OD) Disorder
 Separation Anxiety (SA)**

The table also includes the results for the indicators for diagnosis plus impairment.

As expected, the students in the high-risk control group showed higher instance of diagnosis and larger criterion counts than the low-risk students in the normative sample.

V. Recommendations for Use

It is recommended that the analyst use categorical-type analyses when examining diagnosis and diagnosis plus impairment variables and continuous-type analyses for criterion count variables. There have been numerous studies using the CDISC that the analyst can refer to for comparison of results and method used.

Analysts should refer to the numerous previous studies that have used the CDISC for examples of methods used to analyze these data.
