I. Survey Description

The Income and Employment Survey is a series of questions that measure multiple aspects of employment and income for jobs within the last year. The original scoring method was established by Howe and Frazis (1992) at the Bureau of Labor Statistics, as part of the National Longitudinal Surveys (NLSY97, Round 3). The NLSY97 was designed to gather information at multiple points in time about the youth labor market. Items used in the Fast Track interviews were adapted from the NLSY97, Round 3 employment section and the NLSY97, Round 3 income section. This measure was added to the Fast Track protocol in year 13 (2003) for cohort 1.

The Income and Employment Survey is a paper survey measuring 42 employment and income characteristics. Responses include multiple choice categorical scales, free response and dichotomous scales (yes /no responses).

II. Report Sample

These analyses were conducted on the first cohort on the high-risk Control sample (n = 155) and the Normative sample (n = 387, N = 463 with overlap) for the fifteenth year of the study. Ninety three records were missing for the complete measure. Thirty-six records from the Control sample (7 from Durham, 14 from Nashville, 3 from Pennsylvania and 12 from Washington) and 57 records were missing from the Normative sample (13 from Durham, 17 from Nashville, 13 from Pennsylvania and 14 from Washington).

III. Frequencies and Means – Selected Variables

The questionnaire probes the respondents up to 3 jobs. The tables below display values for selected variables for job #1. Very limited number of respondents report data for second and/or third job. The user should note that missing values are represented by a period (.), 'D' stands for "Don't Know", 'N' stands for "No Answer", 'R' stands for "Refused to Answer" and 'S' stands for "Skipped".

IV. Recommendations for Use

The Income and Employment Survey allows for the standardization of data collection regarding the participant's previous year's income and employment. The survey measures key factors related to employment and earnings. This report displays a limited number of variables, primarily to the first job only. The user is encouraged to investigate variables for second and third jobs and produce aggregated measures. The counts for second and third jobs are very small. The user is also encouraged to compute and aggregate sources of income. Verbatim description of the type of jobs the respondents perform has been displayed to indicate job activities. For classification of employment activities, the user is also encouraged to use either Census or Hollingshead classification. Variables C15BF5a and C15BF5b measure job classification using Hollingshead and Census codes.
