Scored: PDR10

### **I. Scale Description**

The PDR is a 30-item checklist of behavior problems developed at the Oregon Social Learning Center. Parents are asked to indicate the presence of each behavior problem (did or did not occur) during the past 24 hours. The first administration of the PDR took place during the summer interview with parents. Then, parents received several follow-up telephone calls from interview staff during the two weeks following the summer interview. During the first year of the project, four follow-up telephone calls were made to parents. After initial analyses suggested that it required only three reports to get a reliable estimate of child behavior problems, the number of follow-up telephone calls was reduced to two (in addition to one administration at the time of the interview). For all of the following analyses, parent's reports of their child's behavior were averaged across the first three administrations of the PDR.

Finally, in year 9 of administration, this measure underwent some revisions and a number of the items were updated. From year 9 on, there were 37 items in the PDR. Items PxKP1-5 were dropped entirely from the measure. New items included whether the child ate a meal with the parent (PxK6), how many hours the child had spent at home without an adult present (PxK7), whether the parent had talked with the child's friends' parents (PxK13), whether the child had used tobacco (PxK33), alcohol (PxK34), or drugs (PxK35), whether the child had participated in any positive social activities (PxK43), and how accurate the interviewer thought that the information was (PxK44). Several items were similar to the original version of the measure, such as whether the child had eating problems (now item PxK41) or whether the child seemed hyperactive (now item PxK42). This newer version was used for year 9 and every year thereafter in the study.

## **II. Report Sample**

These exploratory analyses were conducted with the first cohort on the control sample ( $n=155$ ) and on the normative sample ( $n=387$  including overlap, total  $N=463$ ) from the tenth year of the study. 100 records were missing responses for the entire measure. 34 were from the control sample (3 from Durham, 14 from Nashville, 9 from Pennsylvania, and 8 from Washington) and 87 were from the normative sample (12 from Durham, 32 from Nashville, 22 from Pennsylvania, and 21 from Washington). Some of these may represent overlap between samples.

Four items were missing more than 100 responses. They were MP10K12—parents talked with the child's friends (104 missing), MP10K13--the child was out after 7pm last night without an adult (104 missing), MP10K14—the parent communicated calmly with the child (104 missing), and MP10K23—the child hit brothers/sisters (105 missing).

## **III. Scaling**

When this measure was computerized in year 9, the measure's response options as to whether a behavior had occurred changed such that 0 = no and 1 = yes. Thus, the reversal of the items in the scoring program, as done in previous years, was dropped, except for item 29 (purposefully destroys property). This item continued to be reverse-scored.

Due to the changes in the measure in year 9, the subscales were revised. *Oppositional and Aggressive* was modified to include items MPxK16-MPxK18, MPxK20, MPxK22, and MPxK25-MPxK27. These items included talks back to an adult, screams, swears at someone, physically fights with anyone, teases anyone, lies, takes something that does not belong to them, and disobeys parent.

Three new subscales for year 9+ were *Prosocial*, *Internalizing*, and *Substance Abuse*. *Prosocial* includes 7 items: MPxK19 (talks respectfully to an adult), MPxK21 (completes a household chore), MPxK24 (shows respect for family), MPxK28 (follows family rules at home), MPxK29r (purposefully destroys property), MPxK31 (volunteers to help with family chore), and MPxK39 (talks about his/her activities). *Internalizing* includes 5 items: MPxK36 (shows signs of sadness/depression), MPxK37 (acts shy), MPxK38 (shows signs of anxiety), MPxK40 (has sleeping problems), and MPxK41 (has eating problems). *Substance Abuse* is made up of 3 items: MPxK33 (uses tobacco), MPxK34 (uses alcohol), and MPxK35 (uses drugs).

Cronbach's alphas were calculated for each subscale and are shown in the table below:

Subscales	Cronbach's Alpha	
	Control Sample	Normative Sample
Oppositional and Aggressive (PDR10OAG)	.62	.66
Prosocial (PDR10PRO)	.70	.56
Internalizing (PDR10INT)	.33	.55
Substance Abuse (PDR10SUB)	.46	.31

The reliability coefficients for internal consistency were moderate for two subscales, *Oppositional and Aggressive* and *Prosocial*, for both the normative and control samples. The subscales *Internalizing* and *Substance Abuse* showed a low level of internal consistency for both samples. It should also be noted that the reliability coefficient for the normative sample in the *Oppositional and Aggressive* subscale was greater than the reliability coefficient for the control sample.

#### IV. Differences Between Groups

A series of t-tests comparing the high-risk control sample and the normative sample (including the overlap) indicated significant differences for three of the subscales. These were the *Oppositional and Aggressive* subscale, the *Prosocial* subscale, and the *Substance Abuse* subscale. The *Oppositional and Aggressive* subscale also indicated that the mean for the normative sample was greater than the mean for the control sample (0.85 and 0.80, respectively).

Two items also indicated significant differences between the normative and control samples. These were the parent talks with the parents of the child's friends (MP10K15) and the child seems hyperactive (MP10K42). Six items indicated that the mean for the normative sample was greater than the mean for the control sample. These were the parent and child eat a meal together (MP10K8), the number of hours the child spends at home without an adult (MP10K9), whether the child is out after 7pm last night without an adult (MP10K13), the parent talks with the parents of the child's friends (MP10K15), the child participates in positive social activities (MP10K43), and the accuracy of the information (MP10K44).

Accuracy of information (MP10K44)	4.12	0.62	4.06	0.70	360	-0.91	0.3624

## **V. Recommendations for Use**

Analysts should note that analyses were not run for two of the items, MP10K6 and MP10K7. Item MP10K6 refers to the number or occasion of the Parent Daily Report (i.e. 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup>) and item MP10K7 refers to the date of the interview.

Analysts should note that one subscale, *Prosocial*, was negatively skewed for both samples. The other three subscales were positively skewed for both the normative and control samples. In addition, these three subscales also showed floor effects for both samples. For the *Oppositional and Aggressive* subscale in the normative sample, 84% of the responses ranged between 0 and 0.125, while in the control group 69% of the responses ranged between 0 and 0.125. For the *Internalizing* subscale, 80% of the normative sample and 73% of the control sample had responses of zero. Finally, for the *Substance Abuse* subscale, 93% of the normative sample and 86% of the control sample had responses of zero.

The low internal consistency coefficients for certain subscales are not necessarily worrisome. A scale based on a checklist format does not have the same psychometric qualities as a scale based on a common factor model, and a low coefficient alpha is especially likely for measures of low-frequency events (such as substance use).
