I. Scale Description

The Relationship Adjustment Scale is a 28-item measure that evaluates satisfaction in the relationship of spouses or domestic partners. The Relationship Adjustment Scale is adapted from the instrument developed by Spanier (1976).

Each item on the Relationship Adjustment Scale asks about an interaction between domestic partners or spouses, or about a behavior that occurs in relationships. Different groups of items contain slightly different response choices; however, all items (except two) estimate frequency, and all response choices are coded from zero to five. For example, one group of items asks how often the respondent and spouse/partner agree on issues such as handling family money, ways of thinking about life, and dealing with parents or in-laws. For these items, responses include: "Always Disagree (0)," "Almost Always Disagree (1)," "Frequently Disagree (2)," "Occasionally Disagree (3)," "Almost Always Agree (4)," and "Always Agree (5)." Another group of items asks how often the respondent thinks or behaves in a certain way. For example, "Do you ever regret that you married (or lived together)?" Responses for these items include: "Never (0)," "Rarely (1)," "Occasionally (2)," "More Often than Not (3)," "Most of the Time (4)," and "All of the Time (5)." Other questions have similar response choices.

Two items do not contain frequency responses: one item asks the respondent to rate the overall "amount of happiness" in the relationship. Response options are: "Extremely Unhappy (0)," "Fairly Unhappy (1)," "A Little Unhappy (2)," "Happy (3)," "Very Happy (4)," "Perfect (5)." The other item asks how the respondent feels about the future of the relationship,

¹ Original rating instrument.

with six discrete answer choices.

II. Report Sample

This report contains data collected on Cohort 1, Year 12. The data include a high-risk control sample (n=155) and a normative sample (n = 387) for a total N = 463, including overlap. Single-parent respondents have missing answers for the entire Relationship Adjustment Scale. Of the 463 subjects, 285 are missing all responses, including 198 from the normative group (56 from Durham, 46 from Washington, 31 from Pennsylvania, and 65 from Nashville), and 87 from the control group (18 from Durham, 31 from Nashville, 16 from Pennsylvania, and 22 from Washington), with overlap between the normative and control groups. None of these measures was used in the analyses.

III. Scaling

The Relationship Adjustment Scale does not contain subscales. A total score is calculated as the mean of responses to the 28 items multiplied by 28.² Total scores on the Relationship Adjustment Scale range between 0 - 140. In addition, a dichotomous score ("1" = relationship distress, "0" = no distress) is formed using a clinical cutoff of 88 on the total score. Respondents with a total score below the clinical cutoff receive a "1" to indicate elevated frequency of distress symptoms. If more than 14 items on a measure are missing responses (i.e., 50%), a total score is not calculated. Measures with all responses missing are not scored.

The alpha coefficients for the normative sample and control sample are:

	Normative Sample	Control Sample
Relationship Adjustment Scale	0.95	0.93

IV. Differences Between Groups

T-tests of means on the total relationship distress score between the normative and control samples yielded the following results:

	Normative Sample		Control Sample		DF	t Value	Pr > t
	Mean	SD	Mean	SD			
Relationship Adjustment Scale –Total Score	104.41	19.73	99.85	18.00	224	-1.63	0.1036

² Response codes for five item responses are inverted before the 28 items are summed.

The frequency distribution of the distress score among the high-risk control and normative samples is:

Table of Relationship Distress Score by Group			
Relationship Distress Score	Sample		
Frequency Col Pct	Control	Normative	Total
No Distress (0)	55 80.88*	141 89.24	196
Distress (1)	13 19.12	17 10.76	30
Total	68	158	226

^aColumn Percentage

Frequency Missing = 237

With $\chi^2 (1, N = 226) = 0.288, p < 0.089$, the hypothesis of independence between risk category (Normative or High-Risk Control) and symptoms of distress cannot be rejected for these data.

V. Recommendations for Use

The strong internal consistency indicates that the continuous score is useful. If a diagnostic indicator is desired, the dichotomous score of relationship distress is available.

For this study year, results of the analyses do not show a significant difference between the normative and high-risk groups. Also, for this year, the Relationship Adjustment Scale is slightly skewed in a negative direction for the normative and control groups.
