#### **I. Scale Description**

On the Social Health Profile form are items comprising two measures. Twenty-six of the behavior rating items are from the TOCA-R, developed by Shep Kellam and his colleagues, reflecting three dimensions of behavioral adjustment to school (Cognitive Concentration, Authority Acceptance, and Social Contact). Nine behavior-rating items were added by CPPRG to assess social competence for the Fast Track Project. In addition, two items on this form request teacher ratings of the degree of peer liking and peer disliking toward each child, and four items ask about specific aspects of adjustment (days absent, substance use, and likelihood of school promotion in the coming year.)

The TOCA-R scales are described in a technical report available from Kellam and his colleagues at Johns Hopkins and in a published study (Werthamer-Larsson, Kellam & Wheeler, 1991). The scales assess attentional skills and academic performance (Cognitive Concentration), aggressive and disruptive behavior (Authority Acceptance), and shyness/social withdrawal (Social Contact).

In addition, nine items were drawn from the Social Competence Scale developed by the CPPRG for Fast Track. Five of these items reflect prosocial behaviors and four represent emotion regulation. The measure is administered in a face-to-face interview with each classroom teacher. Typically, ratings are collected on all children in the classroom.

## II. Report Sample

Primary analyses were conducted on Cohort 1 year 6 normative (n=387) and high risk control samples (n=155, overlap is 79). 57 students were missing the entire measure (12% of the sample), including 48 from the normative sample (12% of the sample) and 18 of the control sample (12% of the sample). The non-respondents included 11 students from the Durham site, 21 from Nashville, 19 from Pennstate and 6 from the Seattle site; 34 white and 20 black students; 25 girls and 32 boys.

## III. Scaling

### A.) TOCA-R Scoring Method

Kellam and colleagues report a 3-factor solution for the TOCA-R. The items loading on each factor are as follows (note that items that require reversed scoring are noted with an R):

Cognitive Concentration: 2R (self-reliant), 4R (works hard), 7R (learns up to ability), 8 (distractible), 9R (concentrates), 14 R (completes assignments), 16 (poor effort), 17R (eager to learn), 20R (stays on task), 22R (pays attention), 32 (mind wanders), 34R (works well alone).

Authority Acceptance: 3 (takes property), 5(yells at others), 6 (fights), 10 (stubborn), 12 (lies), 15 (breaks rules), 19 (teases others), 21 (breaks things), 23 (harms others), 24 (disobedient).

Social Contact: 25R (initiates interactions), 26R (plays with others), 28R (social contact with others), 31 (avoids contact).

### B.) Social Competence Items

The items selected from the Social Competence Scale (teacher version) to reflect two dimensions of social competence are as follows: - Prosocial: 1R (friendly), 13R (helpful), 18R (resolves peer problems), 33R (understands others), 35R (suggests without bossiness);

- Emotional regulation: 11R (controls temper in a disagreement), 27R (appropriate expression of needs/feelings), 29R (thinks before acting), 30R (can calm down).

Although the two aspects of social competence (prosocial and emotional regulation) are separate conceptually, the correlation between the two scales is high (.86 on the normative sample). The two scales should be scored separately only when a strong theoretical rationale supports making this distinction. For most research purposes, these items will be combined to score a single social competence scale.

With a strong conceptual justification, it may be appropriate in some research studies to score smaller groups of items to reflect the narrow-band dimensions of behavior problems identified on other measures. Note that these narrow-band dimensions of behavior problems are comprised of only a few items each and are not supported by the factor analysis of this measure. The possible narrow-band dimensions that could be scored from the measure are:

1. Overt Aggression: 5 (yells), 6 (fights), 19 (teases), 21 (breaks things), 23 (harms others)
2. Oppositional: 10 (stubborn), 15 (breaks rules), 24 (has trouble accepting authority)
3. Covert Antisocial: 3 (takes people's property), 12 (lies)

Finally, the single items 36 and 37 (liking and disliking items) can be used as single items to assess teacher estimations of peer status.

Reliability coefficients for the scales:

<u>Scale</u>	<u>Normative sample</u>	<u>Control sample</u>
Cognitive concentration	.97	.94
Authority acceptance	.94	.91

Social contact	.89	.83
Overt aggression	.87	.84
oppositional	.87	.81
Covert antisocial	.78	.73
Prosocial	.89	.84
Emotional regulation	.89	.87
Social competence	.94	.92

#### IV. Differences Between Groups

T-tests of mean comparisons were conducted between the normative (non-high-risk) and the high-risk control group. All tests were found significant at the .05 significance level. The students in the control group consistently exhibited more behavior problems and less social competence skills than the students in the normative (non-high risk) group.

#### V. Recommendations for Use

The TOCA-R and SHP Social Competence Scales have demonstrated strong internal consistency, and good concurrent and predictive validity. When all children in a classroom are assessed, the measure provides information about classroom group characteristics, as well as child characteristics.

#### VI. Item and Scale Means and SD's

Normative sample:
