Scored: WSR1

I. Scale Description

Portions of the Wechsler Intelligence Scale for Children-Revised (WISC-R) were used in years 1 and 2 for all three cohorts to assess child intelligence in early elementary school. The WISC-R was developed by David Wechsler (1974) as a second version of the intelligence scale originally introduced in 1949. For the Fast Track Project, a “short form” of the WISC-R was used which included two of the ten subtests: Block Design (from the Performance module of the WISC) and Vocabulary (from the Verbal Ability module). The short form score was then converted into an Estimated IQ Score using methods provided by Sattler (1992).

II. Report Sample

These exploratory analyses were conducted on the first cohort on the high-risk sample ($n = 310$) and the normative sample ($n = 387$, $N = 618$ with overlap) from the first year of the study. No records were missing the entire measure.

III. Scaling

Scoring tables from the WISC-R manual were used to create separate age-adjusted scores for the two subtests for year 1. Since test administration dates were not recorded when the WISC was given, date of administration from the Family Information Form (FIF) was used as an approximate interview date of the WISC as these two instruments were typically administered on the same day in year 1. Child age was calculated by subtracting date of birth from the FIF date of administration. Raw sum scores for the Vocabulary test (WSR1SVO) and the Block Design test (WSR1SBD) were converted into scaled scores, which were coded WSR1ZVO (for Vocabulary) and WSR1ZBD (for Block Design), and were adjusted for the child's age at the time of test administration. The scaling process was based on a norming population with a mean score of 10 and standard deviation of 3 on each subtest.

Estimated IQ Scores were created by combining the scaled Block Design and Vocabulary scores within year and then using tables provided by Sattler (1992, p.851) to convert to an IQ score (WSR1IQ), normed on a score with a mean of 100 and a standard deviation of 15.

IV. Differences between Groups

There were significant differences noted between the normative and high-risk sample for all of the scores such that the normative sample scored higher than the high-risk sample on all of the subtests.

WISC-R—Subtests, Normative vs. High-Risk
The TTEST Procedure

Variable	Normative Sample		High-Risk Sample		DF	t Value	Pr > t
	Mean	Std Dev	Mean	Std Dev			
Block Design Raw Score (WSR1SBD)	8.06	6.39	5.69	5.10	616	-5.10	<.0001
Vocabulary Raw Score (WSR1SVO)	13.73	5.23	12.52	4.51	615	-3.09	0.0021
Block Design Age-Adjusted Score (WSR1ZBD)	9.23	2.99	7.63	3.15	611	-6.48	<.0001
Vocabulary Age-Adjusted Score (WSR1ZVO)	9.41	3.55	8.38	3.00	610	-3.89	0.0001
Estimated IQ Score (WSR1IQ)	95.10	18.39	85.90	16.65	610	-6.48	<.0001

WISC-R—Subtests, Control vs. Intervention
The TTEST Procedure

Variable	Control Sample		Intervention Sample		DF	t Value	Pr > t
	Mean	Std Dev	Mean	Std Dev			
Block Design Raw Score (WSR1SBD)	5.28	4.94	6.10	5.24	308	-1.43	0.1545
Vocabulary Raw Score (WSR1SVO)	12.27	4.58	12.77	4.44	307	-0.96	0.3354
Block Design Age-Adjusted Score (WSR1ZBD)	7.44	3.17	7.82	3.12	303	-1.06	0.2908
Vocabulary Age-Adjusted Score (WSR1ZVO)	8.23	3.09	8.52	2.90	302	-0.85	0.3980
Estimated IQ Score (WSR1IQ)	84.81	16.76	87.03	16.52	302	-1.17	0.2444

V. Recommendations for Use

The *Block Design Raw Score* was positively skewed in the normative sample and the high-risk sample. The *Vocabulary Raw Score*, the *Block Design Age-Adjusted Score*, the *Vocabulary Age-Adjusted Score*, and the *Year 1 Estimated IQ Score* were all normally distributed for both the normative and the high-risk samples.

A limitation for using WSR1IQ is the absence of norms for children under age 6 (Sattler, 1992).¹ Since age-norming tables for the WISC-R have a lower limit of age 6 years, 0 months (age 6-0), scores for children under age 6 in the Fast Track Project were scaled based on the youngest age bracket available (age 6-0 to age 6-3). A substantial proportion of the year one cohort one sample -- 22% of the normative sample and 22% of the high-risk sample -- were under the age of 6.0 years, and thus have potentially inappropriately scaled scores. The result of this in terms of distributions is a mild floor effect and heavier tail for the year one IQ scores.

Depending on the question being addressed, analysts may use the estimated IQ scores or the separate subtest, age-adjusted scores.

¹ Sattler (1992, p.142) also notes that norms for children between age 6-0 years and age 6-3 years were created by extrapolation instead of actually testing children in that age group; thus, norms for this age may be unreliable as well.

VI. Item and Scale Means and SDs
