### **I. Scale Description**

The Interview on Emotional Experience is a 22-item measure given to children as part of the summer interview for the first four years of the study. The measure focuses on four emotions—happiness, sadness, anger, and worry/nervousness. For each emotion, the child is asked several questions about the emotion and the interviewer then codes the child's responses. The first question the child is asked for each emotion is, "What kinds of things make you feel ... (happy, sad, angry, worried)?" The interviewer prompts the child for two examples/responses for this question and then codes each response as appropriate, inappropriate, or no response. The second question the child is asked for each emotion is, "When you are feeling ... (happy, sad, angry, worried), what kinds of things do you do?" The interviewer prompts the child for two responses for this question and then codes each response as one of the following: no response (0), physically aggressive (1), verbally aggressive (2), avoidant/passive (3), affective display (4), communication with adult (5), communication with peer (6), self-control (7), prosocial (8), or doing things/other (9). Finally, for the emotions sad, angry, and worried, the child is asked, "If you saw another kid in your class looking ... (sad, angry, worried), what would you do?" Again the interviewer prompts the child for two responses and then codes the responses using the same scale (0-9) as for the

second question. This results in a total of four possible responses for happiness (two responses each for questions one and two only) and six possible responses each for sadness, anger, and worry/nervousness (two responses each for all three questions).

## II. Report Sample

These exploratory analyses were conducted on the first cohort on the high-risk sample (n = 310) and the normative sample (n = 387 with overlap, total N = 618) from the first year of the study. 7 records were missing the complete measure. 3 records were missing from the high-risk sample (1 from Nashville and 2 from Pennsylvania) and 5 records were missing from the normative sample (1 from Nashville and 4 from Pennsylvania). These numbers may reflect some overlap between the two samples.

## III. Scaling

A number of scores and several scales are calculated as part of the Interview on Emotional Experience. Only the first response to each question are considered in the analyses of this instrument, even though the child is asked for and prompted for two responses to each question. The original response coding (0-9) for each item was transformed into a set of 10 dichotomous variables. First, a score is computed for each child in each of the response categories across the second and third questions by summing the number of times a child had a response for a category, resulting in 10 scores for the child (no response, physically aggressive, verbally aggressive, avoidant/passive, affective display, communication with adult, communication with peer, self-control, prosocial, or doing things/other). The child's score for each of these categories ranges from 0 to 7, with 0 being a low score (indicating that no response fit the category) and 7 being a high score (indicating that all of the child's responses fit the category), since only the first response to each question is included in the scoring program (this would then include the second question about happiness and the second and third questions about sadness, anger, and worry). A score of zero for one of these categories would indicate that the child gave responses that did not fit into that category (for example, the child might not have used any responses indicating the use of verbal aggression), while a score of 7 would indicate that the child used a particular type of response often (for example, the child might have used responses that showed communication with their peers when dealing with all of their emotions).

In addition, an *Appropriateness Score* is calculated by summing the number of times a child described an appropriate response for the emotion for the first question, "What kinds of things make you feel...?" This score can range from 0 to 4 since only the first response for each emotion was included in the scoring program. A standardized *Appropriateness Score* was also created because the standard deviation among the four items that make up the scale showed great variation for both the high-risk sample and the normative sample. Even with the standardization of the score, there was still some variation among the standard deviation of these items because the standardization was done on the full sample, and the variances differed somewhat by high-risk status. To create the standardized score, the items were first standardized with a mean of zero and a standard deviation of one, and then mean was calculated as the score.

Finally, several scales are created as well by taking summing together two of the category scores and taking their mean. The scales include the *Aggression Scale* (Physical Aggression Score + Verbal Aggression Score), the *Communication Scale* (Communicates with Adults Score + Communicates with Peers Score), and the *Positive Response Scale* (Prosocial Score + Self-Control Score). These three scales have a range of 0 to 7.

Cronbach's alphas were calculated for each score and can be seen in the following table:

Subscales	Cronbach's Alpha	
	High-Risk Sample	Normative Sample
Aggression Scale (IEE1AGG)	.32	.21
Communication Scale (IEE1COM)	.47	.53
Positive Response Scale (IEE1PRS)	.44	.50
Appropriateness Score (IEE1ASC)	.33	.34
Appropriateness Score Standardized (IEE1ASCz)	.57	.45
No Response Score (IEE1NRS)	.66	.69
Physical Aggression Score (IEE1PAG)	.35	.24
Verbal Aggression Score (IEE1VAG)	.24	.10
Avoidant/Passive Score (IEE1APS)	.38	.36
Affective Display Score (IEE1ADS)	.36	.40
Communication with Adults Score (IEE1CWA)	.57	.62
Communication with Peers Score (IEE1CWP)	.28	.46
Self-Control Score (IEE1SCS)	.10	.31
Prosocial Score (IEE1PSS)	.51	.55
Do Nothing Score (IEE1DNS)	.22	.39

Only one score, the *No Response Score*, showed an adequate internal reliability for both the normative and the high-risk sample. One other score, the *Communicates with Adults Score*, showed an adequate internal reliability for the normative sample only.

#### IV. Differences between Groups

A series of t-tests between the high-risk sample (not including the overlap) and the normative sample indicated significant differences for four scores: the *Aggression Scale*, the *Positive Response Scale*, the *Self-Control Score*, and the *Prosocial Score*. For three of these scores--the *Positive Response Scale*, the *Self-Control Score*, and the *Prosocial Score*—the mean for the normative sample was greater than the mean for the control sample. No significant differences between the control and intervention samples for the scales were found. Generally, these findings seem to suggest that children in the normative sample were more likely to use self-control and to do things that were more prosocial (helping someone or saying something nice) when dealing with their emotions than the children in the control sample. Conversely, it also appears that children in the control sample were more likely to use aggression as a way to deal with their emotions.

Interview on Emotional Experience—Subscales, Normative vs. High-Risk

Variable	Normative Sample		High-Risk Sample		DF	t Value	Pr >  t
	Mean	Std Dev	Mean	Std Dev			
Aggression Scale (IEE1AGG)	0.23	0.35	0.30	0.43	616	2.15	0.0319

Do Nothing Score (IEE1DNS)	1.40	0.99	1.44	0.97	308	-0.35	0.7290

## V. Recommendations for Use

Analysts should note that three scores showed a normal distribution for both the normative and the high-risk samples: the *Positive Response Scale*, the *Do Nothing Score*, and the *Prosocial Score*. The *Appropriateness Score* and the *Appropriateness Score Standardized* were negatively skewed for both samples. All of the other scores were positively distributed for both the normative and the high-risk samples.

A number of scores showed floor effects. They included: the *Physical Aggression Score* (with 68% of the high-risk sample and 72% of the normative sample scoring a 0), the *Verbal Aggression Score* (with 85% of the high-risk sample and the 89% of the normative sample scoring a 0), the *Affective Display Score* (with 70% of the high-risk sample and 64% of the normative sample scoring a 0), the *Communicates with Peers* (with 87% of the high-risk sample and 88% of the normative sample scoring a 0), and the *Self-Control Score* (with 90% of the high-risk sample and 87% of the normative sample scoring a 0). The *Aggression Scale* also had floor effects for both samples. For the high-risk sample, 59% of the sample scored a 0.0 on the scale, while 87% of the total sample scored 0.5 or lower. For the normative sample, 64% scored 0.0 while a total of 93% of the sample scored 0.5 or lower.

One score, the *Appropriateness Score*, showed a ceiling effects with 63% of the normative sample and 60% of the high-risk sample scoring a 4. In addition, the means for the items in the *Appropriateness Score* were very close to 2.0 (the highest possible mean for an appropriateness item).

In addition, it needs to be noted that a number of items in the scales and scores had a zero variation. Scales and scores affected by the zero variation for some items include the *Aggression Scale* (high-risk sample), the *Positive Response Scale* (high-risk and normative samples), the *Physical Aggression Score* (high-risk sample), the *Verbal Aggression Score* (high-risk sample), and the *Self-Control Score* (high-risk and normative samples).
