## I. Scale Description

The sociometric interview assesses peer's perceptions of children in their classroom on a variety of dimensions (Coie, Dodge, \& Coppotelli, 1982). The interview is administered individually at school. Children are presented with a roster of all the students in their classroom. They first rate how much they
like, or do not like, to play with each child in their classroom. On the 1st and 2nd grade forms, these ratings were made on a 3 -point scale; for the 3rd grade form, this was expanded to a 5 -point scale. For grade 4, no roster ratings were collected. After completing the roster ratings the children are then asked to nominate other children in their classroom on the following dimensions: liked most, liked least, aggression (who are the kids who start fights and say mean things), withdrawn (who are the kids who are shy and act afraid to be around other kids) behavior, prosocial (who are the kids who cooperate, help, and share) behavior, hyperactivity (who are the kids who get out of their seats and bother people), and victim (who gets picked on and teased by other kids) behavior. In grades 1,2 , and 3 , children responded to these questions using both unlimited and fixed (top 3) nominations. In grade 4, only unlimited nominations were included. Adequate reliability and cross-contextual stability has been demonstrated for these assessments.

Social preference and social impact scores were also calculated, based on the like least and like most scores. This was done to assess the degree to which a child might be considered cooperative and supportive (a high social preference score) and the degree to which a child has influence in the classroom, positive or negative (high social impact).

In addition to sociometric items, a series of questions was developed for the Fast Track project that assess children's liking of school and loneliness. The number of items for this section has gradually increased over time, from 8 in grades 1 and 2 to 12 items in grade 3 to 21 items in grade 4 .

## II. Report Sample

These analyses were conducted on the first cohort on the high-risk control sample ( $n=155$ ) and the normative sample ( $\mathrm{n}=387,463$ with overlap) from the second year of the study. Sociometric scores are based on the responses by a child's peers, so it is possible for a child to have scores even if he or she did not actually respond. As a result, data on the number of missing responses is broken into two parts: one reflecting the sociometric scores and the other reflecting the self-report items.

For the sociometric scores, 56 records were missing the complete measure. Twelve records were missing from the control sample (2 from Durham, 2 from Nashville, 1 from Pennsylvania, and 7 from Washington) and 50 records were missing from the normative sample ( 12 from Durham, 21 from Nashville, 3 from Pennsylvania, and 14 from Washington). These numbers may reflect some overlap between the two samples.

For the self-report items, 142 records were missing; 40 from the control sample (13 from Durham, 11 from Nashville, 5 from Pennsylvania, and 11 from Washington) and 123 records were missing from the normative sample ( 32 from Durham, 45 from Nashville, 16 from Pennsylvania, and 30 from Washington). These numbers may reflect some overlap between the two samples.

## III. Scaling

The first step in obtaining data was to use roster ratings. Subjects received mean scores for nominations given to others in their class and nominations received from other students in their classroom. For the roster ratings, a low value signified high 'like to play' scores either given or received. For instance, when the three-point scale was used, a " 1 " signified that a child liked another child a lot, while a " 3 " signified that the child did not like the other child at all. The same is true of the five-point scale, where a " 1 " still signified that a child liked another child a lot and a " 5 " meant that the child did not like the other child at all. For nominations for the like most/like least categories and for the behaviors (aggression, hyperactivity, withdrawn behavior, prosocial behavior, and victim behavior) students were simply asked to name children who fit each described category.

The next step was to determine the sociometric scores for each student. As stated earlier, children responded to the roster ratings using both unlimited and fixed (top 3) nominations. Some users of
sociometric measures rely on receiving a person's top 3, or fixed, nominations for a category. Others rely on allowing the person to nominate an unlimited number of people for a category. Both types of nominations were used in this year 2 version of the measure.

Individual items were scored by summing nominations across all children in the classroom. Both raw scores and z scores are available for both types of sociometric scores (unlimited and fixed). The z-scores are standardized within each classroom group. In addition, standardized social preference and social impact items were scored as follows:

Social Preference: standardized Liked Most - standardized Liked Least (score is then re-standardized)
Social Impact: standardized Liked Most + standardized Liked Least (score is then re-standardized)
In 1997 new standardized variables were created by standardizing scores within classroom and by sex. Generally children's peer interactions are typically sex-segregated, particularly in elementary school. By including only same-sex children in the computation of sociometric scores, the assessments of peer status would be more valid, and would better reflect the peer reality of elementary school. The variables that break down the data by sex replace the " $z$ " in the variables' names with a " $g$," but are otherwise similar in name to the original standardized variable. For example, C2EZAGGS represents "Aggressive sum z-score" for the original standardized variable and C2EGAGGS represents "Aggressive z-score by sex" for the new standardized variable.

In addition, peer status variables were created to identify the subject's classification in one of the five status groups (Average, Popular, Neglected, Rejected, or Controversial) using combinations of the Social Preference, Social Impact, Like Least, and Like Most variables (see table below).

| Peer Status | $\|$Social Preference $z$-score $\geq 1+$ Like Least sum z-score $<0+$ Like Most <br> sum $z$-score $>0$ |
| :--- | :--- |
| Ropular | Social Preference $z$-score $\leq-1+$ Like Least sum $z$-score $>0+$ Like Most <br> sum $z$-score $<0$ |
| Neglected | Social Impact $z$-score $\leq-1$ <br> Social Impact $z$-score $\geq 1+$ Like Least sum z-score $\geq 0+$ Like Most sum z- <br> score $\geq 0$ |
| Average | Does not fit any of the other categories |

These status groupings were calculated in the same way for both the unlimited and fixed nominations.
Finally, the self-report items were completed by the child using "yes" or "no" responses. These questions included 1 (is school fun for you), 2 (do nice things happen to you at school), 3 (do you feel unhappy at school-reversed), 4 (do you like your school), 5 (do you have kids to play with at school), 6 (are you lonely at school-reversed), 7 (is it hard to make friends at school-reversed), and 8 (do kids at school like you). A summary scale score, School Satisfaction, based on factor analysis, can be used for these self-report items. The "yes" responses were converted to " 1 " and the "no" responses were converted to " 0 ." Thus, a high score for this scale would be an 8.

Cronbach's alphas were calculated for both samples of the School Satisfaction scale: . 52 for the control sample and .61 for the normative sample.

## IV. Differences between Groups

A series of t-tests between the high-risk control sample and the normative sample (including the overlap) indicated significant differences for 24 of the 29 z -score and mean roster rating items. Respondents from the normative sample tended to score higher in the categories such as 'like most' (both top 3 and unlimited), being withdrawn, being prosocial, and the social preference scores. Respondents from the
control sample, on the other hand, scored higher in categories such as 'like least' (both top 3 and unlimited), being aggressive, being hyperactive, the social impact scores, and the mean roster ratings.

Two z-scores approached significance, Victim Sum Z-Score (C2EZVICS, p = 0.08) and Social Impact ZScore (unlimited) by Sex (C2EGSIMU, p=0.09), with the respondents from the control sample scoring higher than those from the normative sample for both scores.

A t-test for the scale, School Satisfaction, did not indicate significant differences between the samples.

| Comparison of Means for Normative and Control for Sociometrics Y2 |  |  |  |  |  |  |  |  |

The frequency distribution of the Status Grouping of the Top 3 between the high-risk control and normative samples was:

| Table of C2ESTAT3 by group |  |  |  |
| :--- | ---: | ---: | ---: |
| C2ESTAT3 (Status Grouping (Based on top | Group |  |  |
| 3)) |  |  |  |
| Frequency <br> Column Percent |  | Control | Normative |

With $\chi^{2}(4, \mathrm{~N}=407)=65.6798, \mathrm{p}<0.0001$, the hypothesis of independence between risk category (normative or high-risk control) and diagnosis of the status grouping of the top 3 was rejected for these data.

The frequency distribution of the Status Grouping unlimited between the high-risk control and normative samples was:

| Table of C2ESTATU by group |  |  |  |
| :---: | :---: | :---: | :---: |
| C2ESTATU (Status Grouping (Based on unl)) | Group |  | Total |
| Frequency Column Percent | Control | Normative |  |
| AVERAGE | $\begin{array}{r} 60 \\ 41.96 \end{array}$ | $\begin{array}{r} 143 \\ 54.17 \end{array}$ | 203 |
| CONTROVERSIAL | $\begin{array}{r} 12 \\ 8.39 \end{array}$ | $\begin{array}{r} 13 \\ 4.92 \end{array}$ | 25 |
| NEGLECTED | $\begin{array}{r} 16 \\ 11.19 \end{array}$ | $\begin{array}{r} 38 \\ 14.39 \end{array}$ | 54 |
| POPULAR | 3 2.10 | $\begin{array}{r} 45 \\ 17.05 \end{array}$ | 48 |
| REJECTED | $\begin{array}{r} 52 \\ 36.36 \end{array}$ | $\begin{array}{r} 25 \\ 9.47 \end{array}$ | 77 |
| Total | $\begin{array}{r} 143 \\ 35.14 \end{array}$ | $\begin{array}{r} 264 \\ 64.86 \end{array}$ | $\begin{array}{r} 407 \\ 100.00 \end{array}$ |
| Frequency Missing = 56 |  |  |  |

With $\chi^{2}(4, \mathrm{~N}=407)=58.3399, \mathrm{p}<0.0001$, the hypothesis of independence between risk category (normative or high-risk control) and diagnosis of the status grouping unlimited was rejected for these data.

In comparing Status Grouping by Top 3 versus Status Grouping unlimited, the normative sample in both cases tended to have more students in the average, popular, and neglected groupings. The control sample tended to have more students classified as rejected, with $38 \%$ by the top 3 ratings and $36 \%$ by the unlimited ratings. For the controversial classification, the normative sample had double the percentage of students than did the control students for the top 3 ratings, but the control sample had double the percentage of students in the unlimited ratings.

The frequency distribution of the Status Grouping of the Top 3 by sex between the high-risk control and normative samples was:

| Table of C2EGSTA3 by group |  |  |  |
| :---: | :---: | :---: | :---: |
| C2EGSTA3 (status groupings (top 3) by sex) | Group |  | Total |
| Frequency Column Percent | Control | Normative |  |
| AVERAGE | $\begin{array}{r} 58 \\ 40.56 \end{array}$ | $\begin{array}{r} 109 \\ 41.29 \end{array}$ | 167 |
| CONTROVERSIAL | $\begin{array}{r} 7 \\ 4.90 \end{array}$ | $\begin{array}{r} 17 \\ 6.44 \end{array}$ | 24 |
| NEGLECTED | $\begin{array}{r} 24 \\ 16.78 \end{array}$ | $\begin{array}{r} 57 \\ 21.59 \end{array}$ | 81 |
| POPULAR | $\begin{array}{r} 5 \\ 3.50 \end{array}$ | $\begin{array}{r} 53 \\ 20.08 \end{array}$ | 58 |
| REJECTED | $\begin{array}{r} 49 \\ 34.27 \end{array}$ | $\begin{array}{r} 28 \\ 10.61 \end{array}$ | 77 |
| Total | $\begin{array}{r} 143 \\ 35.14 \end{array}$ | $\begin{array}{r} 264 \\ 64.86 \end{array}$ | $\begin{array}{r} 407 \\ 100.00 \end{array}$ |
| Frequency Missing = 56 |  |  |  |

With $\chi^{2}(4, \mathrm{~N}=407)=46.8009, \mathrm{p}<0.0016$, the hypothesis of independence between risk category (normative or high-risk control) and diagnosis of the status grouping of the top 3 by sex was rejected for these data.

Chi square tests were also run on the status groupings that are by sex. The frequency distribution of the Status Grouping unlimited by sex between the high-risk control and normative samples was:

| Table of C2EGSTAT by group |  |  |  |
| :---: | :---: | :---: | :---: |
| C2EGSTAT (status groupings (unl) by sex) | Group |  | Total |
| Frequency Column Percent | Control | Normative |  |
| AVERAGE | $\begin{array}{r} 55 \\ 38.46 \end{array}$ | $\begin{array}{r} 114 \\ 43.18 \end{array}$ | 169 |
| CONTROVERSIAL | $\begin{array}{r} 13 \\ 9.09 \end{array}$ | $\begin{array}{r} 19 \\ 7.20 \end{array}$ | 32 |
| NEGLECTED | $\begin{array}{r} 18 \\ 12.59 \end{array}$ | $\begin{array}{r} 44 \\ 16.67 \end{array}$ | 62 |
| POPULAR | $\begin{array}{r} 7 \\ 4.90 \end{array}$ | $\begin{array}{r} 57 \\ 21.59 \end{array}$ | 64 |
| REJECTED | $\begin{array}{r} 50 \\ 34.97 \end{array}$ | $\begin{array}{r} 30 \\ 11.36 \end{array}$ | 80 |
| Total | $\begin{array}{r} 143 \\ 35.14 \end{array}$ | $\begin{array}{r} 264 \\ 64.86 \end{array}$ | $\begin{array}{r} 407 \\ 100.00 \end{array}$ |
| Frequency Missing $=56$ |  |  |  |

With $\chi^{2}(4, \mathrm{~N}=407)=44.6630, \mathrm{p}<0.0001$, the hypothesis of independence between risk category (normative or high-risk control) and diagnosis of the status grouping unlimited by sex was rejected for these data.

In examining the status groupings by sex where the ratings were limited to the top 3, researchers should note that there were more students from the normative group for the categories of average, neglected, controversial, and popular 3, while the control sample tended to have a higher percentage of students in the rejected category. For the ratings that were unlimited and by sex, the normative sample had more students in the average, neglected and popular categories, while a higher percentage of control students were in the controversial and rejected categories.

## V. Recommendations for Use

Analysts should note that 18 of the $z$-scores were normally distributed for both the normative and the control samples. One z-score, C2EZWDRS (withdrawn behavior sum z-score), was positively skewed for both samples.

Five z-scores were positively skewed for the normative sample but were normally distributed for the control sample: C2EZLLS3 (like least sum z-score top 3), C2EZAGGS (aggressive sum z-score), C2EZHYPS (hyperactive sum z-score), C2EZPROS (prosocial z-score by sex), and C2EGHYPS (hyperactive $z$-score by sex). Two z-scores were positively skewed for the control sample and normally distributed for the normative sample: C2EGLMS3 (like most top $3 z$-score by sex) and C2EZLMS3 (like most top 3 z-score).

Two scores, the mean roster rating given by respondent (C2ERRGIV) and the mean roster rating received by the respondent (C2ERRREC), were normally distributed for both samples. Another score, the standard deviation of the mean roster rating received by the respondent (C2ERRSTD), was negatively skewed for both of the samples.

Finally, the School Satisfaction scale was normally distributed for both the control and the normative samples.

## VI. Item Means and SDs

Sociometrics Self-Report Items Normative Sample Year 2

| Variable | Label | $\mathbf{N}$ | Mean | Std Dev | Minimum | Maximum |
