**I. Scale Description**

The Revised Social Competence Scale – Teacher Version is a 17-item measure that assesses a child’s prosocial behavior, emotional self-regulation, and academic skills. The Revised Social Competence Scale was created for the Fast Track Project (Gifford-Smith, 2000) and contains items adapted from the original Scale and from the Teacher Post Ratings (Maumary-Gremaud & Miller-Johnson, 1995).

Each item on the Social Competence Scale states a behavior that a child may display at school. Examples include: “Listen carefully to others,” and “Obey classroom rules and teachers’ directions.” The teacher assesses how well each statement describes the child. Each item has two response sets. One response set assesses the *frequency* of the behavior using a six-point scale: “Almost Never (0),” “Rarely (1),” “Sometimes (2),” “Often (3),” “Very Often (4),” and “Almost Always (5).” The second response set assesses the *change in the behavior* over the course of the school year, with responses coded on a seven-point scale: “Much Worse (0),” “Somewhat Worse (1),” “A Little Worse (2),” “No Change (3),” “A Little Improved (4),” “Somewhat Improved (5),” and “Much Improved (6).”

**II. Report Sample**

This report contains data collected on Cohort 1, Year 8. The data include a high-risk control sample (n=155) and a normative sample (n = 387) for a total N = 463, including overlap. Of the 463 subjects, 103 are missing all responses,

including 75 from the normative group (8 from Durham, 23 from Washington, 12 from Pennsylvania, and 32 from Nashville), and 28 from the control group (3 from Durham, 13 from Nashville, 4 from Pennsylvania, and 8 from Washington), with overlap between the normative and control groups. None of these measures was used in the analyses.

### III. Scaling

The Social Competence Scale contains three subscales: Prosocial Skills, Emotional Regulation Skills, and Academic Competence. Based on results of exploratory factor analyses in the development of the Scale, some items change subscales depending on whether the frequency of behavior or the change in behavior is in focus. For example, “Easily irritated when troubled by task” is on the Emotional Regulation Subscale when assessing the frequency of the behavior, but on the Academic Competence Subscale when assessing the change in behavior. For each response set, the three subscale scores, a score for the combined Prosocial Skills and Emotional Regulation items, and a total score on all 17 items are reported. Scores are calculated as the mean of responses. If more than half of the items for a scale are missing responses, the score is not calculated. Measures with all responses missing are not scored.

For each response set, the alpha coefficients for the normative sample and control sample are in the tables below.

#### Frequency of Behavior

|  | Normative Sample | Control Sample |

#### IV. Differences Between Groups

T-tests of means on the total score, the combined score, and the subscale scores between the normative and control samples yielded the following results:

#### V. Recommendations for Use

For both the frequency of behavior and behavior change responses, the internal consistency measure (Cronbach alpha values) indicates that the total score and subscale scores are useful.

For the frequency of behavior response set, t-tests of means for subscale scores and for the total score show significant differences between the normative and control groups in this study year. The t-test results for behavior change responses do not show a difference between the normative and control groups. In analyses using a similar construct, the frequency response set may better assess sample differences. Analysts using the Scale should also be aware that items shift in the subscales, depending on whether frequency of behavior or behavior change is the focus.
